

DURABLE MEMORY GATE

Before implementation begins, classify this stage:

BREADCRUMB IMPACT: YES / NO / UNKNOWN

If YES or UNKNOWN:

identify which durable architectural rule may change and which Breadcrumb / Contract section owns that truth.

Do not wait until the end of the task to discover that architecture changed.

At completion, verify one of:

BREADCRUMBS UPDATED

or

NO DURABLE BREADCRUMB CHANGE

with a short reason.

Also classify:

DIAGNOSTIC IMPACT: YES / NO

If this stage introduces a new runtime component, important state transition, failure boundary, external dependency, path contract, deployment boundary, or identity concept, ensure the diagnostic system can expose that truth.

Reports are working evidence, not automatically permanent architecture.

A stage report may be retired after closure only when all durable information it contains is represented by the appropriate combination of:

- architecture breadcrumbs
- contracts
- automated tests
- diagnostic runtime memory
- source code / schema where self-describing

Do not permanently delete historical reports automatically.

Retirement/archive requires a separate approved cleanup stage.
